L2.61/11:

Producer Price Indexes is a monthly report on producer price movements including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights. A subscription may be ordered from the Superintendent of Documents, U. S. Government Printing Office, Washington, DC 20402.

Material in this publication is in the public domain and, with appropriate credit, may be reproduced without permission. Second-class postage paid at Washington, DC, and at additional mailing offices.

Supplement to Producer Price Indexes Data for 1990

Preface

This annual *Supplement to Producer Price Indexes* presents monthly indexes and annual averages for 1990. Indexes shown in the *Supplement* are not seasonally adjusted. The *Supplement* also provides information on the relative importance of components at the end of the year.

Information on changes in the sample for producer price indexes during 1990

can be found in the January 1990 and July 1990 issues of *Producer Price Indexes*. Included in the *Supplement* are tables showing the correspondence between industry-based product codes and traditional commodity codes at the detailed level, as of January 1991.

Price Highlights, 1990

A sudden and steep jump in energy prices during the late summer and autumn partially eclipsed a trend towards weaker prices at the producer level for many other kinds of goods in 1990.

From December 1989 to December 1990, the Producer Price Index for Finished Goods moved up 5.7 percent, compared with an advance of 4.9 percent in 1989. The 1990 increase was the largest since 1981, when it was 7.1 percent. At the intermediate stage of processing, prices received by domestic producers rose 4.3 percent, nearly twice as much as a year earlier. Crude material price increases slowed somewhat, however, from 7.1 percent in 1989 to 6.0 percent.

For the year as a whole, the finished energy goods index advanced 30.7 percent following a rise of 9.5 percent in 1989. Similarly, the intermediate energy goods index was up 21.8 percent in 1990, vs. 10.6 percent a year earlier. The index for crude energy goods rose 19.1 percent in 1990, not much more than in 1989, when it climbed 17.9 percent.

The faster increase in energy prices contrasted with the generally lower levels of inflation in other sectors. The index of finished goods other than energy slowed to a rise of 3.2 percent in 1990, following a 4.5-percent increase the year before. At the intermediate level, prices for nonenergy goods moved up less than 2 percent for the second consecutive year. Crude material prices outside the energy sector, up 0.9 percent in 1989, fell 2.7 percent a year later.

One of the major features distinguishing price behavior in 1990 from episodes of rapid increases in energy prices in the 1970's was the apparently limited

passthrough of energy-related price increases in the rest of the economy. While prices for some materials derived from petroleum did rise substantially, there was little evidence by the end of the year that these cost pressures were being translated directly into higher prices for finished products. Several factors may have contributed to this departure from the previous pattern. Perhaps the most important was the sluggish state of the general economy that was developing even before the Kuwait crisis and which became much more evident afterwards, leaving producers unwilling or unable to raise prices. Other factors included lags in raising prices to reflect increased costs, the possibility that the energy price surge might be quickly reversed, and a relatively restrictive monetary policy that the Federal Reserve Board eased only gradually.

As had been the case throughout the 1980's, events affecting import and export markets had a major effect on producer price movements in 1990. The continued depreciation of the U.S. dollar in international currency markets stimulated exports of many American-made goods, partially offsetting poor demand from domestic buyers. The lower value of the American dollar also raised prices of imports, providing some relief to domestic producers which allowed them either to raise their own prices or to capture a greater market share. The extent of foreign competition nevertheless remained strong enough to encourage domestic producers to continue emphasizing cost-cutting steps, thereby alleviating inflationary pressures.

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents.² Industry and product class indexes may include products not shown separately.³ Not available.

n.e.c. = Not elsewhere classified.

m.p.m. = Made from purchased materials.

n.s.k. = Not specified by kind.

Note: The annual average calculation method for the indexes in this table differ from the method used for indexes in table 4. The method used in table 3 averages the unrounded monthly indexes and also includes unpublished monthly data. Therefore, the annual averages shown above may not agree with those computed by averaging the monthly indexes shown.

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents. Indexes in this table are derived from the primary product indexes in table 3 that are weighted using 1977 input/output relationships. These indexes only include inputs to construction which are produced by the mining and manufacturing sectors of the

economy, excluding capital equipment. Since they do not include labor or capital costs, these indexes should not be regarded as comprehensive measures of changes in construction costs. See note on page 190 of *Producer Price Indexes Data for October 1990*.

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents. Indexes in this table are derived from the product indexes in table 3. These indexes are composed of the goods used by the industries in each of the industry stage of process output indexes as

shown by the 1977 input/output relationships. These material inputs include only domestic material inputs and do not include any imported materials which may be used.

¹ The relative importance of a component represents its value weight that is allocated to a particular stage-of-processing (SOP) category—finished goods, intermediate materials, or crude materials—expressed as a percentage of the total weight of the SOP category. The "Revised" column shows relative importance figures for December 1990 based on 1982 shipment values from the Census of Manufactures and other sources, after the sample revision effective January 1991. The "Former" relative importance figures are for

the same month before the revision of the index sample. Except for recodes, a dash in the "Former" column indicates that the series was introduced in January 1991 and a dash in the "Revised" column indicates that the series was discontinued as of January 1991. Individual items and subtotals may not add exactly to totals because of rounding differences. The value of 0.000 represents a percentage less than 0.0005.

¹ The relative importance of a component represents its value weight that is allocated to a particular stage-of-processing (SOP) category—finished goods, intermediate materials, or crude materials—expressed as a percentage of the total weight of the SOP category. The "Revised" column shows relative importance figures for December 1990 based on 1982 shipment values from the Census of Manufactures and other sources, after the sample revision effective January 1991; the "Former" column shows relative importance figures for the same month before revision of the index sample. Groupings and subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents either a percentage less than 0.0005 or a grouping newly introduced or deleted in January 1991 (if the 0.000 appears in the "Former" or "Revised" column, respectively). Newly introduced or deleted groupings may be identified by referring to Table 12.

¹ All relative importance figures in this table are expressed as a percentage of the All Commodities index. The "Revised" column shows relative importance figures for December 1990 based on the new weights taken from 1982 shipment values from the Census of Manufactures and other sources, and reflects all sample revisions effective January 1991. The "Former" column provides relative importance figures for the same month based on the old weights taken from 1982 shipment values, before the January 1991 sample revisions. Except for recodes, a dash in the

"Revised" column indicates a series that was discontinued as of January 1991, while a dash in the "Former" column indicates a series introduced that same month. Subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents a percentage less than 0.005.

² The relative importance data for the three major SOP groupings—finished goods, intermediate materials, and crude materials—do not add up to 100.000 because they exclude the portion of goods allocated to government purchases and exports.

A Guide for Corresponding Commodity and Product Codes

Some product indexes published in table 3 of this *Supplement* correspond to 8-digit commodity indexes in table 4. In these cases, movement of the 8-digit indexes are calculated on the basis of the movement of their counterparts in table 3.

Tables 13 and 14 show the correspondence between industry-based product codes and traditional commodity codes at the detailed level, as of January 1991. Table 13 presents this correspondence information in product code sequence, while table 14 is arranged in commodity code sequence.

These tables are useful when substitute index series in the alternative coding system are needed. For example, data users sometimes need a commodity code series to serve as a substitute for a given product code series because commodity code series often have a longer history than the corresponding product code series. By the same token, data users who can not find precisely what they are looking for among the commodity code series in table 4 should check the product code series for the appropriate industry in table 3 because the latter often are available in more detail. For example, if a user can find only a very broad type of steel mill product under commodity code 10-17 in table 4, he or she could refer to table 14 to learn that industry code 3312 would be the best place to look for a more detailed product series.

Although these tables are helpful in showing the correspondence between the two different coding systems, there are special factors that sometimes prevent an exact equivalence. In particular, a single commodity code may, in some cases, correspond to more than one product code. This may be an important consideration when one coded series is needed to serve as a proxy for another. In the majority of cases where there is a one-to-one correspondence between a commodity code and a product code, monthly percent changes will not be

substantially different. Rounding differences may have some marginal effect on the percent changes because of the different reference bases of the corresponding series; the commodity code indexes in table 4 are published on a base period of 1982=100 or some later base, whereas corresponding product code indexes in table 3 are published on a base of the month of their introduction. However, in those cases where a single commodity code corresponds to more than one product code, the percent changes in the commodity index will normally not match the percent changes in any of its corresponding product codes.

The correspondence of the industry-based product codes and the traditional commodity codes shown in tables 13 and 14 reflect the PPI system as of January 1991. The series additions, deletions, and recodings which occur regularly within the PPI system will increasingly make these tables out of date. Nonetheless, these tables should be quite useful in helping to identify most code correspondences for the next several years.

The pound (#) sign which appears within most of the product codes in tables 13 and 14 signifies that the first 4 digits of the product code also identifies the 4 digits of the industry code in question. The # sign should be regarded as a dash separating different portions of the product codes. To illustrate this point, see the second and third columns of table 3 in this *Supplement*. This # sign notation is adopted from a series codification system used by the Bureau's LABSTAT computer database.

There are rare cases of certain codes for some secondary products which do not contain the # sign. Those codes will be much longer to indicate both the industry code and the non-conforming product code.

Brief Explanation of Producer Price Indexes

Producer price indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,100 commodities and 75,000 quotations per month.

There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes and; (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 3). The commodity structure (table 4) organizes products by similarity of end-use or material composition.

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, and nondurable goods such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses items that are physically complete but that are purchased by

business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the

first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.

Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extension of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 3 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Indexes may be represented by one to three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries also may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 3 correspond to 8-digit commodity indexes in table 4. In these cases, movements of the latter indexes are calculated on the basis of movements of their counterparts in table 3. Although most such indexes continue to be published in table 4 on a base period of 1982=100 or some later base, corresponding indexes in table 3 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "A guide for corresponding commodity and product codes," page 353.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment

to minimize the use of list prices. Prices are normally reported by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends. Weights for most traditional commodity groupings of the PPI, as well as all indexes (such as stage-of-processing indexes) calculated from traditional commodity groupings, currently reflect 1982 values of shipments as reported in the Census of Manufactures and other sources. From January 1976 through December 1986, PPI weights were derived from 1972 shipment values. Industry indexes, which are based on the SIC system, continue to be calculated with 1977 net output weights.

Effective with publication of January 1988 data, many important PPI series (including all stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982=100, to coincide with the reference year of shipment weights. From 1971 through 1987, the standard reference base for most PPI series was 1967=100. Except for rounding differences, the shift to the new reference base did not cause any changes to previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The new reference base is not used for indexes with a base later than December 1981, nor for indexes for the net output of industries and their products.

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5
Index Percent Change	
Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Results multiplied by 100	0.034×100
Equals percent change	3.4

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a given 3- or 6-month span were maintained for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1982 or some later month). An increase of 3.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 103.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1982 to \$103.50 today." Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods today are 10 percent lower than they were in 1982.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about

the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 807, available on request from BLS.)

Seasonal factors used in computing seasonally adjusted indexes are derived from the X-11 Seasonal Adjustment Method. Annual updates replace the most recent 5 years of seasonal data, e.g., data from January 1983 through December 1987 were replaced at the beginning of 1988. Indexes for most broad commodity groupings and 8-digit individual commodities in table 4, as well as industry and Census product indexes in table 3, do not undergo the seasonal adjustment process and, therefore, are published only as unadjusted data.

Some indexes are adjusted directly, independently of the seasonal movements of other more detailed series comprising the category in question. This is the case for all indexes in table 4 which are adjusted, as well as for certain basic stage-of-processing categories in table 1. Seasonal movements for most stage-of-processing indexes are derived indirectly by the aggregate method, which combines seasonal movements of the basic stage-of-processing categories, and from a wide variety of food and certain other subproduct class (6-digit level) series.

Direct seasonal adjustment produces a more complete elimination of seasonal movements than the aggregative method does. However, the direct seasonal adjustment process does not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonally adjusted data can also become problematic when previously stable and predictable timing patterns of pricing behaviour abruptly change. If the new timing pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will be chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.

Where to Find Information on Employment and Unemployment

Employment and Earnings:

Monthly periodical containing labor force and establishment data. National, State, and area figures on employment, unemployment, hours, and earnings. Order *Employment and Earnings* from Superintendent of Documents, U.S. Government Printing Office, Washington, DC. 20402. Includes text, statistical tables, and technical notes.

Electronic News Release:

Quickest. Accessible electronically immediately at release time through BLS news release service. Write the Office of Publications, Bureau of Labor Statistics, Washington, DC. 20212, or call (202) 523-1913.

Employment Situation News Release:

Copies of this national monthly release reach the public about a week after the release date. Write: Inquiries and Correspondence, Bureau of Labor Statistics, Washington, DC. 20212.

Telephone:

Quick summary on 24-hour recorded message. Key numbers, plus other BLS indicators and upcoming release dates. Call (202) 523-9658.

Machine-Readable Form:

Labor force data from the household survey and employment, hours, and earnings data from the establishment survey are available on both computer tape and diskette. For information, write the Office of Publications, Bureau of Labor Statistics, Washington, DC. 20212 or call (202) 523-1000.

Monthly Labor Review:

Employment and unemployment statistics included in monthly 53-page summary of BLS data and in analytical articles. Available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC. 20402.
